I'm a highly motivated person looking for my first real-world experience building and testing software. I've made my initial steps into the tech world by pursuing a Master's in Management and Information Technology. Throughout my years of study, I gradually built a relationship with my responsibilities regarding organization and time planning to complete tasks and projects efficiently.

I attended the Academy387 course in Selenium testing frameworks. These were my first steps towards QA where I had a chance to learn the basics of automation.

After these steps, I decided to explore other testing frameworks. My first pick was Cypress which I learned from a Udemy course and reading Cypress documentation.

I have excellent attention to detail, which helps me create better tests and catch edge cases during development.

To prove how much I want to be a participant in this internship, I decided to E2E test the AtlantBH application process. I did basic automation testing with Cypress, and here is a link to my Github repo: https://github.com/Bamina78/AtlantBH-Internship-Application
